

# Data Networks – Signaling Resource Reservation Protocol (RSVP)

Prof. Anja Feldmann, Ph.D.

# RSVP design goals

1. Accommodate **heterogeneous receivers** (different bandwidth along paths)
2. Accommodate different applications **with different resource requirements**
3. Make **multicast a first class service**, with adaptation to multicast group membership
4. **Leverage existing multicast/unicast routing**, with adaptation to changes in underlying unicast, multicast routes
5. **Control protocol overhead** to grow (at worst) linear in # receivers
6. **Modular design** for heterogeneous underlying technologies

# RSVP does not ...

- Specify how resources are to be reserved
  - Rather: a mechanism for communicating needs
- Determine routes packets will take
  - That's the job of routing protocols
  - Signaling decoupled from routing
- Interact with forwarding of packets
  - Separation of control (signaling) and data (forwarding) planes

# RSVP: Overview of operation

## Senders and receivers join a multicast group

- Done outside of RSVP
- Senders need not join group

## Sender-to-network signaling

- *Path message*: make sender presence known to routers
- Path teardown: delete sender's path state from routers

## Receiver-to-network signaling

- *Reservation message*: reserve resources from sender(s) to receiver (specified by the receiver)
- Reservation teardown: remove receiver reservations

## Network-to-end-system signaling

- Path error
- Reservation error

# Path msgs: RSVP sender-to-network signaling

- **Path message** contents:
  - **Address:** Unicast destination, or multicast group
  - **Flowspec:** Bandwidth requirements spec.
  - **Filter flag:** If yes, record identities of upstream senders (to allow packets filtering by source)
  - **Previous hop:** Upstream router/host ID
  - **Refresh time:** Time until this info times out
- **Path message:** Communicates sender info, and reverse-path-to-sender routing info
  - Also: Upstream forwarding of receiver reservations (later)

# RSVP: Simple audio conference

- H1, H2, H3, H4, H5 both senders and receivers
- Multicast group m1
- No filtering: Packets from any sender forwarded
- Audio rate:  $b$
- Only one multicast routing tree possible

# RSVP: Building up path state

- H1, ..., H5 all send path messages on m1:  
(address=m1, Tspec=b, filter-spec=no-filter, refresh=100)
- Suppose H1 sends first path message

# RSVP: Building up path state

- Next, H5 sends path message, creating more state in routers

# RSVP: Building up path state

- H2, H3, H5 send path msgs, completing path state tables

# Reservation msgs: Receiver-to-network signal

- **Reservation** message contents:
  - **Desired bandwidth**
  - **Filter type** (who can use the reservation)
  - **Filter spec** (data for the filter, e.g., sender names)
- Reservations flow upstream from receiver-to-senders, reserving resources, creating additional, receiver-related state at routers

# RSVP: Receiver reservation – example

- H1 wants to receive audio from all other senders
- H1 reservation msg flows uptree to sources
- H1 only reserves enough bandwidth for 1 audio stream
- Reservation is of type "no filter" – any sender can use reserved bandwidth

# RSVP: Receiver reservation – example

- H1 reservation msgs flows uptree to sources
- Routers, hosts reserve bandwidth  $b$  needed on downstream links towards H1

# RSVP: Receiver reservation – example

- Next, H2 makes no-filter reservation for bandwidth  $b$
- H2 forwards to R1, R1 forwards to H1 and R2
- R2 takes no action, since  $b$  already reserved on L6

# RSVP: Soft-state

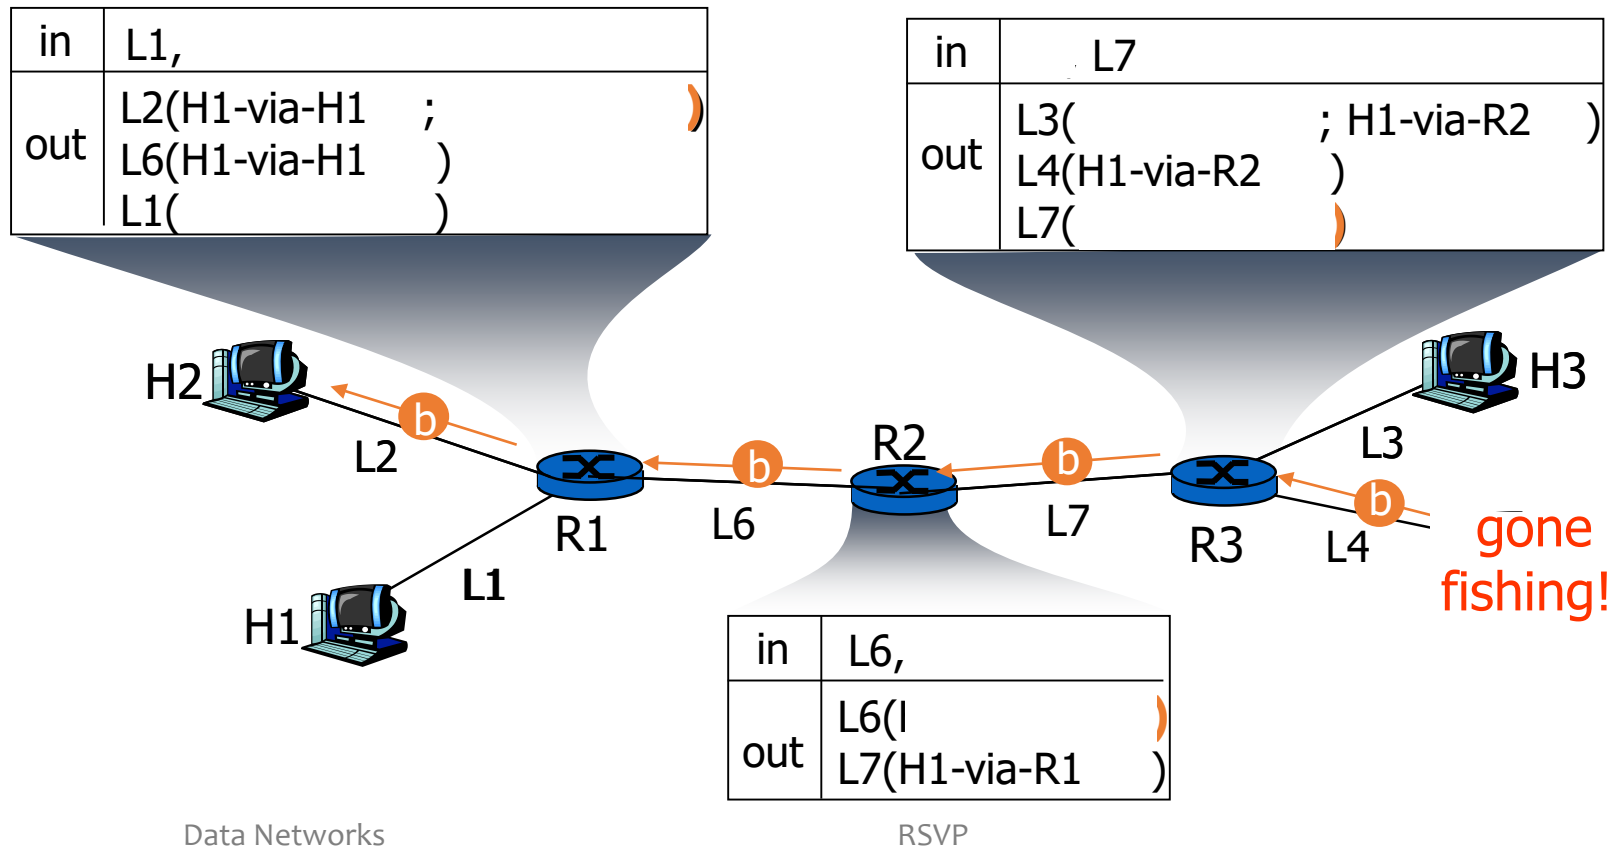

- Senders periodically resend path msgs to refresh (maintain) state
- Receivers periodically resend resv msgs to refresh (maintain) state
- Path and resv msgs have TTL field, specifying refresh interval

# RSVP: Soft-state

- Suppose H4 (sender) leaves without performing teardown
- Eventually state in routers will timeout and disappear!

# Use cases for reservation/path refresh

- Recover from an earlier lost refresh message
  - Expected time until refresh received must be shorter than timeout interval!
- Handle receiver/sender that goes away without teardown
  - Sender/receiver state will timeout and disappear
- Path changes will be reflected in the “new reservations”
- Reservation refreshes will cause new reservations to be made to a receiver from a sender who has joined since receivers last reservation refresh

# RSVP: Some reflections

- Multicast as a “first class” service
- Receiver-oriented reservations
- Use of soft-state

# Signaling

**Signaling:** Exchange of messages among network entities to enable (provide service) to connection/call

## Before, during, after connection/call

- Call setup and teardown
- Call maintenance
- Measurement, billing

## Between

- End-user <-> network
- End-user <-> end-user
- Network element <-> network element
